Release report

This document shows what `mdsh --pdf` makes of a run. Run it with

```
mdsh --pdf pdf/report.pdf report.md
```

and the PDF holds what `mdsh report.md` would print: the prose, every block, and the output each block printed. The copy in pdf/report.pdf was made that way.

Checklist

Step	Block	Shows
Count the targets	targets	plain text output
Summarize them	summary	markdown output, drawn as a table
Check the config	config	a failing block and its stderr
List the build	tree	a terminal-style screenshot

Targets

```
sh {#targets}
printf '%s\n' linux/amd64 linux/arm64 darwin/arm64 windows/amd64 | sort
```

```
darwin/arm64
linux/amd64
linux/arm64
windows/amd64
```

A block with `out=markdown` prints markdown, which becomes part of the document, so this table is drawn like any other:

```
sh {#summary out=markdown}
echo '| OS | Targets |'
echo '| --- | ---: |'
for os in darwin linux windows; do
  printf '| %s | %d |\n' "$os" "$(printf '%s\n' linux/amd64 linux/arm64 darwin/arm64 w
indows/amd64 | grep -c "^$os/")"
done
```

OS	Targets
darwin	1
linux	2
windows	1

Config

A failing block keeps going by default. Its exit status is shown above the output, and its stderr in red:

```
sh {#config}
echo "reading config.yaml"
echo "config.yaml: missing key 'port'" >&2
false
```

```
exit 1
reading config.yaml
config.yaml: missing key 'port'
```

Build

`out=screenshot` draws the output as a terminal. The PDF draws it as text, so it stays sharp and searchable:

```
sh {#tree out=screenshot}
printf '%s\n' 'dist/' '├── mdsh_darwin_arm64' '├── mdsh_linux_amd64' '├── mdsh_linux_arm64' '└── mdsh_windows_amd64.exe'
```

```
dist/
├── mdsh_darwin_arm64
├── mdsh_linux_amd64
├── mdsh_linux_arm64
└── mdsh_windows_amd64.exe
```

The script

Include blocks quote another file. With `number_on` the PDF puts the line numbers in a gutter beside the code:

```
include/greet.sh, lines 4-10
greet() {
    printf 'hello, %s\n' "$1"
}

for name in "$@"; do
    greet "$name"
done
```

> Images, front matter and mdsh's own markers are handled too: PNG, JPEG and GIF images are drawn, and front matter is left out.
